

### **LISTING OF THE CLAIMS**

No claims have been amended, canceled or added in this reply. The following listing of claims is provided for the Examiners convenience.

#### Listing of Claims:

##### Claims 1 – 2 (Canceled)

3. (Previously presented) The method of claim 7 wherein the step of placing a call links said endpoint to said packet-switched conferencing system component through said packet-switched audio conferencing system.
4. (Previously presented) The method of claim 7 wherein routing instructions for said audio conference include at least a location found signal indicating the selected multiple control unit.
5. (Previously presented) The method of claim 7 wherein the call includes at least a location request signal.

6. (Previously presented) A method of establishing an audio conference in an audio conferencing system, the method comprising:

- initiating a call from an endpoint to said audio conferencing system, said call

- indicating said audio conference;

- selecting, in a conference allocation and control system in said audio

- conferencing system, a multiple control unit to host said audio

- conference;

- determining in said conference allocation and control system whether the call

- from said endpoint contains adequate information to establish said audio

- conference;

- responding from said conference allocation and control system to said endpoint

- with routing instructions to an interactive voice response server when

- there is inadequate information to establish said audio conference;

- connecting said endpoint to said interactive voice response server when there is

- inadequate information to route said call;

- gathering in said interactive voice response server, after connecting said

- endpoint to said interactive voice response server, said adequate

- information to establish said audio conference; and

- transferring said endpoint from said interactive voice response server to said

- selected multiple control unit after said interactive voice response server

- gathers said adequate information.

7. (Previously presented) A method for adding an additional endpoint to an audio conference in a purely packet-switched audio conferencing system, said method comprising:

placing a call from an endpoint to a packet-switched conferencing system component, said call indicating an audio conference;

selecting, in a conference allocation and control system in said audio conferencing system, a multiple control unit to host said audio conference;

initiating a call request from said selected multiple control unit to said packet-switched conferencing system, said call request indicating said additional endpoint;

returning a destination address from said packet-switched conferencing system component to said selected multiple control unit, said destination address corresponding to said additional endpoint;

establishing a point-to-point call from said multiple control unit to said additional endpoint based on said destination address, thereby bringing said additional endpoint into said audio conference.

8. (Previously presented) The method of claim 7 further supporting full service audio conferencing using a reservation system and a call agent.

9. (Original) The method of claim 8 wherein the reservation system and the call agent are tightly integrated.

10. (Original) The method of claim 8 wherein the reservation system and the call agent are loosely integrated.

11. (Canceled)

12. (Previously presented) The method of claim 7 further including dynamically routing an operator voice path to service multiple multiple control units.

13. (Previously presented) The method of claim 7 further including renegotiating the destination of a voice path to move an audio conference participant from said selected multiple control unit to a second multiple control unit.

14. (Previously presented) The method of claim 7 further including moving said audio conference from said selected multiple control unit to a second multiple control unit.

15. (Previously presented) The method of claim 7 further comprising:

- providing said audio conference to a streaming protocol server from said selected multiple control unit;
- connecting a passive participant to said streaming protocol server; and
- broadcasting said audio conference from said streaming protocol server to a said passive participant.

Claims 16 – 31 (Canceled)

32. (Previously presented) The method of claim 6 wherein said selecting said multiple control unit comprises:

- selecting in said conference allocation and control system a first multiple control unit to host said audio conference when said audio conference is inactive.

33. (Previously presented) The method of claim 6 wherein said selecting said multiple control unit comprises:

- selecting in said conference allocation and control system a second multiple control unit to host said audio conference when said audio conference is active.

34. (Previously presented) The method of claim 6 further comprising:

- responding from said conference allocation and control system to said endpoint with queried routing instructions, said queried routing instructions indicating said selected multiple control unit.

35. (Previously presented) A method of establishing an audio conference in an audio conferencing system, the method comprising:

- initiating a call from an endpoint to said audio conferencing system, said call indicating said audio conference;
- determining in a conference allocation and control system whether the call from said endpoint contains adequate information to establish said audio conference;
- responding from said conference allocation and control system to said endpoint with routing instructions to an interactive voice response server when there is inadequate information to establish said audio conference;
- connecting said endpoint to said interactive voice response server when there is inadequate information to route said call;
- gathering in said interactive voice response server, after connecting said endpoint to said interactive voice response server, said adequate information to establish said audio conference; and
- transferring said endpoint from said interactive voice response server to said audio conference after said interactive voice response server gathers said adequate information.

36. (Previously presented) The method of claim 35 further comprising:

- selecting, in said conference allocation and control system, a multiple control unit to host said audio conference.

37. (Previously presented) The method of claim 36 further including dynamically routing an operator voice path to service multiple multiple control units.

38. (Previously presented) The method of claim 36 further including renegotiating the destination of a voice path to move an audio conference participant from said selected multiple control unit to a second multiple control unit.

39. (Previously presented) The method of claim 36 further including moving said audio conference from said selected multiple control unit to a second multiple control unit.
